Executive summary

This playbook helps companies deliver AI agents with high adoption rates.

Many companies are exploring how to translate AI interest into tangible business value. The challenge is identifying the right problems for AI agents to solve—those that are deeply tied to real user workflows and deliver measurable outcomes. AI agent use cases often reflect what teams can ship quickly, not what users actually need. Without a clear link to everyday business processes, agents see low adoption—even when they work as intended.

At their core, AI agents retrieve information and automate tasks based on user input, interpreting language

instead of requiring users to switch between applications, fill out forms, or navigate complex interfaces.

This reduces context switching and enables faster decisions with fewer manual steps.

To bridge this gap between AI agent potential and actual business impact, this playbook enables companies to:

- Discover and evaluate the most impactful use cases.
- Implement AI agents that users will actually adopt.
- Measure results that demonstrate real business value.

This approach integrates AI into workflows to drive workforce productivity.

Process for AI agent implementation

In an AI program, adoption follows this four-step process:

1. **Discovery:** Identify use cases from across the organization that address actual user needs.
2. **Selection & Evaluation:** Apply objective criteria to prioritize opportunities with the highest impact and feasibility.

3. **Implementation:** Build solutions with continuous stakeholder feedback to ensure relevance and usability.
4. **Launch:** Integrate solutions into workflows and track metrics that prove business value.

Each cycle improves user adoption and deepens organizational AI capabilities. Let's explore each step one by one.

Step 1: Discovery

The discovery phase establishes channels to gather use cases, identifies champions, and creates questionnaires to capture requirements.

1.1 Setup Inbound Channels: Start by identifying a primary point of contact in each functional team (e.g., support, sales, ops) to champion use case collection. Begin with one channel—such as a dedicated Slack channel or email alias—and expand to others (MS Teams, forms, workshops) as needed. Schedule short workshops or team check-ins to gather use cases directly. Create and share a centralized, accessible repository (e.g. Jira, Confluence, Notion, shared drive) where all stakeholders can view and contribute use cases.

1.2 Identify Champions: Recruit individuals who will champion AI adoption within their departments and identify impactful use cases. Equip champions with demo capabilities to showcase potential use cases to their teams. Their involvement creates a network effect that builds momentum for the overall AI program.

1.3 Develop Questionnaires: Use questions to systematically gather information about potential use cases. Gather information about workflows, pain points, and expected benefits.

See Appendix I for sample questions and key phrases to listen for.

Step 2: Selection & evaluation

Prioritize use cases with highest potential return by assessing both business impact and technical viability.

2.1 Impact Assessment: Evaluate each use case on:

- **Frequency of use:** How often would the capability be needed? Daily use cases typically deliver more value than monthly ones.
- **Employee reach:** How many people would benefit? Solutions that serve larger user populations generally offer greater return on investment.
- **Business benefit:** Would it eliminate manual tasks and streamline processes? or direct value to the business through efficiency gains, cost savings, or new opportunities?
- **Adoption rate:** How likely are users to adopt the solution? Consider existing tool usage patterns, and alignment with established workflows. Identify the number of stakeholders as a target segment.

2.2 Viability: Viability assessment identifies potential roadblocks early in the process. Assess for:

- **Stakeholder support:** Evaluate sponsorship and business unit commitment to the use case implementation.
- **Technical feasibility:** Determine if current product capabilities can fulfill the requirements or if gaps exist, and evaluate the effort required to connect with existing systems.
- **Development time:** Estimate the timeline and resources needed for implementation.

See Appendix II for sample scoring matrices and viability assessment checklists.

2.3 Other Considerations: Gather additional context and incorporate organizational wisdom into the decision-making process. This includes:

- **Urgency:** Evaluate time-sensitive needs driven by internal process changes.
- **Change management barriers:** Identify resistance, training needs, or process integration challenges that could impede success.

Step 3: Implementation

Convert use cases into solutions while maintaining stakeholder engagement and a clear implementation path.

3.1 Stakeholders: Engage operators (process owners) and end users throughout implementation. Regular touch points with these stakeholders maintain alignment and build ownership. RACI matrix (Responsible, Accountable, Consulted, Informed) can be followed for each use case to clarify roles and responsibilities.

3.2 Implementation Path: Structured implementation path maintains focus on delivering value while managing technical complexity. It incorporates feedback loops at each stage to ensure alignment with stakeholder needs and provides clear milestones to track progress.

What implementation looks like:

1. **System analysis:** Understand existing systems and obtain access.
2. **Design:** Define solution architecture and user experience.
3. **Integration:** Connect to required systems and data sources.
4. **Testing:** Validate functionality and performance.
5. **Launch preparation:** Create communication plans and establish metrics.
6. **Continuous improvement:** Establish feedback mechanisms.

Step 4: Launch

Embed the AI agent into workflows and establish metrics to track success.

4.1 Process Integration & Early Adopters:

Process integration ensures the solution becomes part of normal operations rather than an optional add-on. This includes embedding into existing workflows—like time-off management, which all teams rely on—and removing departmental bottlenecks through easy access to self-serve assets or project tracking info that reduce coordination overhead. Early adopters create social proof that accelerates broader acceptance and build momentum.

4.2 Measure What Matters: Implement metrics tracking both adoption and business impact. Implemented use cases establish traction. The usage should reveal engagement beyond initial exploration across the organization. These signals validate the approach and build confidence in the ability to deliver concrete use cases as they expand. Key metrics include:

- **Adoption Rate:** Percentage of target segment users who try the use case.
- **Repeat Usage:** Interactions per user over time.
- **Time Savings:** Hours saved through automation.
- **Error Rate:** Amount of errors to assess improvements.
- **Business KPIs:** Impact on performance indicators in a business unit or overall company.
- **User Satisfaction:** Feedback scores from users.

From playbook to practice

Effective AI agent implementation aligns technology with business needs. This playbook provides a clear, repeatable method to drive both adoption and measurable impact.

By identifying high-value use cases, prioritizing them objectively, implementing with stakeholder input, and measuring results, companies turn AI interest into real business outcomes with agentic workflows.

To succeed, focus on the following:

- Focus on user needs.
- Balance impact and viability.
- Engage stakeholders throughout.
- Measure outcomes that matter.
- Iterate based on feedback.

Following this playbook ensures AI agents are integrated into workflows—not bolted on—boosting productivity, sharpening decisions, and enhancing the overall employee experience. If you want to learn more about how to build scalable AI agents, [book a meeting with us.](#)

moveworks.com

Appendix I – Questions for use case discovery

What to ask?

- What information is hardest to find, and why?
- Where do you spend the most time when managing or tracking projects?
- What challenges do you face when communicating or coordinating with other teams?
- What does your business process look like when performing a task?
- Have you/team used our AI Assistant recently?
- What metrics is your team tracking for success?

What to listen for?

- Phrases like “I spend X hours per week doing...” indicating time-consuming tasks.
- Mentions of “going back and forth between teams” suggesting communication friction.
- References to “checking status” or “following up” indicating tracking inefficiencies.
- Comments about “finding the right information” pointing to knowledge content gaps.
- Expressions of frustration with existing product use suggesting adoption.
- Statements about metrics they’re held accountable for, revealing business impact opportunities.

Appendix II – Selection & evaluation tools

Example scoring matrix for impact assessment (1-3 scale):

Frequency: Daily (3), Weekly (2), Monthly (1)

Employee Reach: >30% (3), 10-30% (2), <10% (1)

Business Benefit: Clear productivity gain (3), Unclear (0)

👉 The binary approach enables quick decision-making, creates consistency across evaluations and accelerates the prioritization process. Double the score when the use case affects more than one team.

3 - Immediate benefit, offers clear productivity gain or cost reduction/saving

0 - Unclear, not certain about benefiting employees or company as it requires investigation with more data

Adoption Rate: Fits existing workflows (3), Moderate adjustment (2), Significant barriers (1)

Use Case	Frequency (1-3)	Employee Reach (1-3)	Business Benefit (0/3)	Cross-Team?	Adoption Rate (1-3)	Total Score
Time Off Management	3 (Daily)	3 (>30%)	3 (Clear gain)	Yes (x2)	3 (Fits workflows)	15
Self-serve Legal Assets	2 (Weekly)	2 (10-30%)	3 (Clear gain)	Yes (x2)	2 (Moderate adjustment)	12
Update Customer Fields in CRM	3 (Daily)	1 (<10%)	3 (Clear gain)	No	2 (Moderate adjustment)	9
Get Slack Channel Recommendations	2 (Weekly)	3 (>30%)	0 (Unclear)	n/a	1 (Difficult)	6

Consider adding a “quick wins” category for use cases that can be implemented with minimal effort but provide immediate value.

Example viability assessment checklist

Stakeholder Support:

- ☐ Sponsor identified.
 - ☐ Business unit leadership supports initiative.
 - ☐ End users consulted and showed interest.
 - ☐ Get developers involved early.
-

Technical Feasibility:

- ☐ Required data sources accessible (e.g. IP-restricted data access).
 - ☐ Current AI capabilities fulfill requirements (e.g. gathering context across multiple turns).
 - ☐ Integration points identified (e.g. API rate limits and throttling requirements).
 - ☐ Evaluate data quality (e.g., recency, completeness, format) and identify necessary data transformations.
-

Development Time:

- ☐ Resource requirements identified.
- ☐ Timeline estimate completed.
- ☐ Dependencies mapped.

Appendix III – Use case template

Use case overview

Name: [Brief descriptive title]

Description: [2-3 sentence overview of what the use case will accomplish]

Business context

Current process: [Description of how the task is currently performed]

Pain points: [Specific problems with the current approach]

Success criteria: [How success will be measured]

User details

Primary users: [Who will directly interact with the solution]

User journey: [Key steps in how users will engage with the solution]

Expected outcomes: [What users should achieve through this solution]

Technical requirements

Data sources: [Required data and access methods]

System integrations: [Other systems the agent needs to interact with]

Functionality: [Key capabilities the agent must provide]

Impact & viability scores

From assessments

Implementation notes

Dependencies: [Critical prerequisites]

Risks & mitigations: [Identified risks and plans to address them]

Timeline estimate: [Expected duration for implementation]

Appendix IV – Key terms

AI Agent: System using language models to understand instructions and perform tasks.

LLM: Model trained on large text datasets to interpret and generate human language.

Use case: Business scenario where an AI agent creates value by automating tasks.

Agentic workflows: Sequences where AI takes proactive steps to complete complex tasks rather than responding to direct commands.

Network effect: Increasing value of technology as more users adopt it, creating self-reinforcing momentum across teams and departments in an organization.

If you are looking for practical ways to bring AI agents into their company strategy and need more information, book a meeting with us today!
